

**METHOD FOR FORMING DUAL WORKFUNCTION HIGH-
PERFORMANCE SUPPORT MOSFETs IN EDRAM ARRAYS**

ABSTRACT OF THE DISCLOSURE

5

Methods of preparing dual workfunction high-performance support metal oxide semiconductor field effect transistor (MOSFETs)/embedded dynamic random access (EDRAM) arrays are provided. The methods describe herein reduce the number of deep-UV masks used in forming the memory structure, decouple the support and
10 arraying processing steps, provide salicided gates, source/drain regions and bitlines, and provide, in some instances, local interconnects at no additional processing costs. Dual workfunction high-performance support MOSFETs/ EDRAM arrays having a gate conductor guard ring and/or local interconnections are also provided.
